

Surge Suppressors

Upgrade

Upgrade Application

Applicable to all machines.

Upgrade Description

Surge suppressors filter incoming power to protect machine components from electrical spikes and surges caused by electrical storms and power-up of other equipment on the same distribution line. Certain areas experience a high frequency of power outages and fluctuations caused by weather or substandard electrical sources. The sensitive electronic components on a machine should and must be protected from "bad" power.

Note: Large surges and/ or lightning can cause replaceable modules to fail.

Upgrade Benefits

- Protects machine against poor incoming supply electricity due to electrical storms and poor incoming power generation
- Especially advantageous for locations in the Southeastern U.S., Third World, or other countries where power is unreliable or where generator back-up is often necessary
- Decreases possible electrical damage
- Increases up time
